Definition 1 — Power set
Let $X$ be a set. The power set of $X$, written $\mathcal{P}(X)$, is the set of all subsets of $X$.

Exercise 2
Determine whether or not each of the following statements is true.

(a) $\varnothing \in \{\{\varnothing\}\}$;
   \[
   \text{False} \quad \text{The only element of } \{\{\varnothing\}\} \text{ is } \{\varnothing\}, \quad \text{and } \varnothing \neq \{\varnothing\}.
   \]

(b) $\varnothing \subseteq \{\{\varnothing\}\}$;
   \[
   \text{True} \quad \text{The empty set is a subset of all sets.}
   \forall a, [a \in \varnothing \Rightarrow a \in X] \text{ is always true since } a \in \varnothing \text{ is always false.}
   \]

(c) $\mathcal{P}(\varnothing(\varnothing)) \in \{\varnothing, \{\varnothing\}, \{\{\varnothing\}\}\}$.
   \[
   \text{True} \quad \mathcal{P}(\varnothing(\varnothing)) = \mathcal{P}(\{\varnothing\}) = \varnothing, \{\varnothing\}, \{\{\varnothing\}\}
   \quad \text{and } \varnothing, \{\varnothing\} \in \varnothing, \{\varnothing\}, \{\{\varnothing\}\}.
   \]

(d) $\mathcal{P}(\varnothing) \subseteq \{\varnothing, \{\varnothing\}, \{\{\varnothing\}\}\}$.
   \[
   \text{False} \quad \{\varnothing\} \in \mathcal{P}(\varnothing)
   \quad \text{but the only elements of } \{\varnothing, \{\varnothing\}, \{\{\varnothing\}\}\}
   \quad \text{are } \varnothing \text{ and } \{\varnothing\}, \{\{\varnothing\}\}, \text{ neither of which is equal to } \{\varnothing\}.
   \]
Definition 3
Let $X$ and $Y$ be sets. The (cartesian) product of $X$ and $Y$, denoted $X \times Y$, is the set of all ordered pairs $(x, y)$, where $x \in X$ and $y \in Y$. That is,

$$X \times Y = \{(x, y) \mid x \in X \land y \in Y\}$$

Ordered pairs satisfy the property that $(x, y) = (a, b)$ if and only if $x = a$ and $y = b$. This is in contrast to sets, which are unordered: for example, $\{0, 1\} = \{1, 0\}$ but $(0, 1) \neq (1, 0)$.

Example 4
On the following pairs axes, sketch the indicated subsets of $\mathbb{R} \times \mathbb{R}$.

$$(\{-3, -1\} \times [0, 2]) \cup ([1, 2] \times [-3, -2])$$

$$(\{-3, -1\} \cup [1, 2]) \times ([0, 2] \cup [-3, -2])$$

Example 5
Let $A, B, X, Y$ be sets. Prove that $(A \times X) \cup (B \times Y) \subseteq (A \cup B) \times (X \cup Y)$.

Let $p \in (A \times X) \cup (B \times Y)$. Then $p \in A \times X$ or $p \in B \times Y$.

- If $p \in A \times X$, then $p = (a, x)$ for some $a \in A$ and $x \in X$. Then $a \in A \cup B$ and $x \in X \cup Y$, so $p \in (A \cup B) \times (X \cup Y)$.

- If $p \in B \times Y$, then $p = (b, y)$ for some $b \in B$ and $y \in Y$. Then $b \in A \cup B$ and $y \in X \cup Y$, so $p \in (A \cup B) \times (X \cup Y)$.

Hence $(A \times X) \cup (B \times Y) \subseteq (A \cup B) \times (X \cup Y)$. 

2
Indexed unions and intersections

We will often have occasion to take the intersection or union not of just two sets, but of an arbitrary collection of sets (even of infinitely many sets).

**Definition 6 — Indexed intersection**

The (indexed) intersection of a family of sets \( \{X_i \mid i \in I\} \) is defined by

\[
\bigcap_{i \in I} X_i = \{a \mid \forall i \in I, a \in X_i\}
\]

**Example 7**

Express the set \( \cap_{n \geq 1} [0, 1 + \frac{1}{n}] \) as an interval.

\[
\cap_{n \geq 1} [0, 1 + \frac{1}{n}] = [0, 1].
\]

The proof of (\(\subseteq\)) is fairly easy.*

For (\(\subseteq\)): Let \( a \in \cap_{n \geq 1} [0, 1 + \frac{1}{n}] \). Then \( a \in [0, 1 + \frac{1}{n}] \) for all \( n \geq 1 \). So \( a \leq 1 \). To see \( a \leq 1 \), note that if we were to have \( a > 1 \) then we'd have \( a \in [0, 1 + \frac{1}{n}] \) for some sufficiently large \( n \), so \( a \in [0, 1 + \frac{1}{n}] \) — contradiction!

So \( 0 \leq a \leq 1 \). So \( a \in [0, 1] \).

**Definition 8 — Indexed union**

The (Indexed) union of \( \{X_i \mid i \in I\} \) is defined by

\[
\bigcup_{i \in I} X_i = \{a \mid \exists i \in I, a \in X_i\}
\]

**Example 9**

Express the set \( \cup_{n \geq 1} (-1 + \frac{1}{n}, 1 - \frac{1}{n}) \) as an interval.

\[
\cup_{n \geq 1} (-1 + \frac{1}{n}, 1 - \frac{1}{n}) = (-1, 1).
\]

Again, one containment is easy.* (This time it's (\(\subseteq\)).

For (\(\subseteq\)): Let \( a \in (-1, 1) \). Then \(-1 < a < 1\), so \( 1 - a > 0 \) and \( a + 1 > 0 \). Let \( n \in \mathbb{N} \) be large enough that \( \frac{a}{n} < 1 - a \) and \( \frac{1}{n} < a + 1 \). Then \(-1 + \frac{1}{n} < a < 1 - \frac{1}{n}\), so \( a \in (-1 + \frac{1}{n}, 1 - \frac{1}{n}) \), and so \( a \in \bigcup_{n \geq 1} (-1 + \frac{1}{n}, 1 - \frac{1}{n}) \).
Theorem 10 — De Morgan's laws for sets
Given sets $A, X, Y$ and a family of sets $\{X_i \mid i \in I\}$, we have
(a) $A \setminus (X \cup Y) = (A \setminus X) \cap (A \setminus Y)$;
(b) $A \setminus (X \cap Y) = (A \setminus X) \cup (A \setminus Y)$;
(c) $A \setminus \bigcup_{i \in I} X_i = \bigcap_{i \in I} (A \setminus X_i)$;
(d) $A \setminus \bigcap_{i \in I} X_i = \bigcup_{i \in I} (A \setminus X_i)$.

Proof of (c)

By double containment.

(c) Let $a \in A \setminus \bigcup_{i \in I} X_i$. Then $a \in A$ and $a \notin \bigcup_{i \in I} X_i$.

So $\exists i \in I, a \in X_i$, so $\forall i \in I, a \notin X_i$. But then

$\forall i \in I, a \in A \setminus X_i$, so $a \in \bigcap_{i \in I} A \setminus X_i$.

(2) Let $a \in \bigcap_{i \in I} A \setminus X_i$. Then $\forall i \in I, a \in A$ and $a \notin X_i$.

In particular, $a \in A$; and $\forall i \in I, a \notin X_i$, so

$\exists i \in I, a \in X_i$, and so $a \notin \bigcup_{i \in I} X_i$.

Hence $a \in A \setminus \bigcup_{i \in I} X_i$.
